Let's Start!

Let's talk about application and system software

Learning Outcome:

Understands systems theories, business processes and basic concepts on IT.
Create a map of processes that allows identifying areas in an information system, using IT tools to generate reports based on the company's needs.

Can Do Statements:

- I can talk about application software.
- I can give information about system software.
- I can mention some basic differences between application software and system software.

Ask your partner:

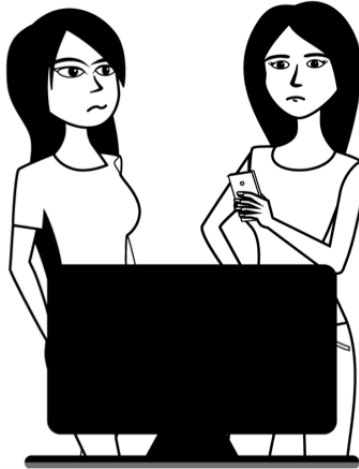

- Do you know any operating systems? Which ones? Are they important?
- What is your favorite operating system? Why?

Let's Explore!

Jack needs to understand the classification of software

Instructions: Read the text below.

- Jack:** Hi, Anna. Thank you for your help. I couldn't attend class yesterday. What did you study?
- Anna:** We learned that software can be categorized into application software and system software.
- Jack:** Oh no! I missed the explanation.
- Anna:** Yes, you did, but let me explain. Application software refers to the computer system and special functions, but system software refers to the computer hardware and other platforms to run application software. In other words, it is used to support, control and run the computer.
- Jack:** Can you give me some examples of system software?
- Anna:** System software can include device drivers, operating systems, utilities, and malware. For example: when you turn on your computer the operating system allows hardware devices to talk to each other, it can control the way they work. Every computer has an operating system like Mac, Windows, and Linux.
- Jack:** Ok, it is clear. And, can you give me some examples of application software?
- Anna:** Yes, I can. Remember, application software is different from system software. That is to say, the application software is the productivity programs because they can enable the user to complete a task. For example, imagine you have a new computer and you only have Windows. Windows offers some basic utility programs like the calculator. If you need to add some numbers up, you can do it with this utility, but if you need to do a more specialized task then you need to install some application software on the computer. This application software can be the Word processor or spreadsheet to do projects or research.
- Jack:** I understand. The application software is a definition we use to describe programs we usually buy or develop to perform a specific task.
- Anna:** Exactly!

Let's Practice!

Features of application software

Instructions: Read the statement. Select all the correct answers.

1. With application software, you can:
 - a. Operate the mouse.
 - b. Write a letter.
 - c. Organize the finances of a company.
 - d. Turn on/off the volume on your computer.
2. Some examples of application software are:
 - a. Word processor.
 - b. Operating system.
 - c. A spreadsheet.
 - d. Screen bright controls.

Let's Practice!

Similar But Not The Same

Instructions: Read the sentences. Write the missing word(s) in the blank. Use: but, and, or.

1. Examples of application software can be a word processor ____ a spreadsheet to do projects.
2. With system software you can operate hardware, ____ you can't make tasks with it.
3. Application software refers to the special functions, ____ system software refers to the computer hardware ____ other platforms.
4. System software refers to device drivers, operating systems, utilities, _____ malware.
5. When you save a document in your computer the operating system allows the hardware devices to communicate _____ control the way they work.

Extension Activity

Let's analyze some system and application software!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for information about typical programs and functions of a computer and analyze them.
- Make a list of the programs you can recognize on the computer.
- Classify the programs into system or application software.
- Present your list to the class.

Self-Assessment

Yes

No

- I analyze the programs in a computer.
- I list the programs in a typical computer.
- I classify the software programs according to their types.
- I present and explain my work to the class.

☐ ☐
☐ ☐
☐ ☐

Target Words

- **malware** (noun): an application software or program design to damage a system
e.g. System software can include device drivers, operating systems, utilities, and malware.
- **turn on** (phrasal verb): to start a machine by pushing or pulling a button
e.g. when you turn on your computer the operating system allows hardware devices to talk to each other, it can control the way they work.
- **allow** (verb): to permit something by giving permission
e.g. when you turn on your computer the operating system allows hardware devices to talk to each other, it can control the way they work.
- **run** (verb): to execute a program or instruction
e.g. An application software refers to the computer system and special functions, but system software refers to the computer hardware and other platforms to run application software.
- **Install** (verb): to move software from a supplying file to a permanent computer environment
e.g. if you need to do a more specialized task then you need to install some application software on the computer.

Learning Points

Simple Connectors

Connectors are words that form different relationships between words and clauses.

Connectors give equal emphasis to the two clauses they connect. They are known as conjunctions. The connectors help you to organize what you say in a more logical form.

The most common simple connector are **but, and, nor, yet** and **or**.

One of the most common connector to make contrast is **but**. It is a connector that joins two independent ideas. They have a subject and a verb. They are commonly followed by a comma.

Examples:

*This application software is not for John, **but** Mark.*

*We're going to buy a computer, **but** we're also going to buy a printer.*

Examples

- *Yes, you did, but let me explain*
- *If you need to do a sum up you can do it with this utility, but if you need to do a more specialized task then you need to upload application software on the computer*
- *We learned that software is categorized into application software and system software.*

Learning Points

Application Software and System Software

Computer software can be classified into types based on common function. These are two general classifications: **application software** and **system software**.

Software performs special functions like basic operation of the computer and entertainment functions. There are many different types of systems and applications software because the range of tasks that can be performed with a computer are big.

Classification:

1. **Application software** refers to the computer system. They are the productivity programs because they enable the user to complete a task. For example, you may use the *Word* processor to write a letter.
2. **System software** refers to the computer hardware and other platforms. These programs are dedicated to manage the computer. For example, the operating system that your computer has like *Window* or *Linux*.

Examples

- System software can include device drivers, operating systems, utilities and malware. For example: when you turn on your computer the operating system allows hardware devices to talk to each other, it can control the way they work.
