Let's Start!

Let's talk about devices and computers!

Learning Outcome:

Understands systems theories, business processes and basic concepts on IT.
Create a map of processes that allows identifying areas in an information system, using IT tools to generate reports based on the company's needs.

Ask your partner:

- Do you know the difference between hardware and software? Share your thoughts.
- Do you use any external devices in your computer? Which ones?

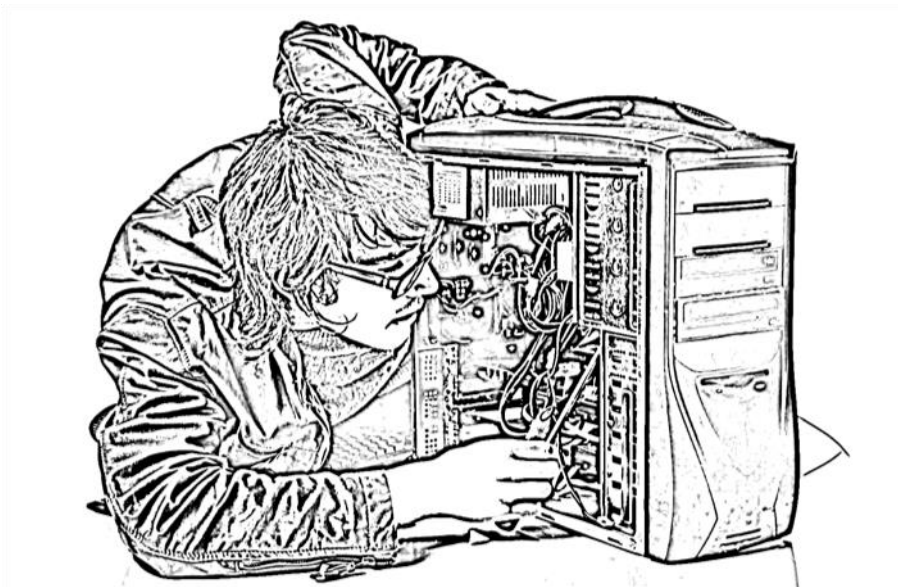

Can Do Statements:

- I can talk about the concept of hardware in a presentation.
- I can describe in a simple way what computer hardware includes.
- I can exemplify system units, peripheral devices, input and output devices.

Let's Explore!

Chris is making a presentation about hardware!

Instructions: Read the text below.

Hello class, this week we are learning about computer systems, so today I am making this presentation to you about a very important topic, which is hardware. When we talk about hardware, we are referring to all the electrical, mechanical, and electronic components of a computer system. That is to say that all the internal circuits and components that make a computer work are basically its hardware. Plus, as these are elements that we can physically touch, we can change and upgrade them at any time to have a better computer.

I can see that many of you are wondering about the components we can find in most computer system units. Well, today many companies are producing a series of different computer systems, like laptops, tablets or desktop computers. However, these all have some basic components in common. Let's check some of them. This motherboard contains all the important circuits of the system; those data storage units save all the important data and information of the system; that graphic card controls all the graphics of the system; and this sound card over here, manages all the sound.

Now, there is something that complements the computer system and that we need to include so it works properly. We are talking about the peripheral devices, which we divide into two different categories. One of them is input devices, which we use to enter information into the system. For example, I am writing on this keyboard to type in letters, symbols, and numbers. We also have output devices, which project or reproduce information to the user; check, for example, this projector that we are using over here.

**Let's Practice!**

Hardware, a Basic Concept

Instructions: Use the words from the box to correctly complete the sentences.

Word Bank

are referring / are learning / am making

1. Hello class, this week we _____ about computer systems.
2. Today I _____ this presentation to you about a very important topic, which is hardware.
3. When we talk about hardware, we _____ to all the electrical, mechanical, and electronic components of a computer system.

**Let's Practice!**

See the hardware working!

Instructions: Proofread the sentences. Correct the mistakes.

1. I was writing on this keyboard to type in letters, symbols, and numbers.

2. Check this projector that we is using over here.

3. She are scanning some important documents on the scanner.

Extension Activity

Let's know more about hardware!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look on the internet for a picture of the inside of a computer's tower and print it.
- Identify as many components as you can, writing their names on the picture.
- Share your picture with the components' names to your class.

Self-Assessment

Yes No

- | | | |
|---|-----------------------|-----------------------|
| 1. I find and print the picture of a computer's tower and I print it. | ☐ | ☐ |
| 2. I identify as many components as I can on my picture. | ☐ | ☐ |
| 3. I present my findings to the class. | ☐ | ☐ |

Target Words

- **wonder** (verb): to ask to yourself
e.g. I can see that many of you are wondering about the components we can find in most computer system units.
- **storage** (noun): the capacity to save information for later use
e.g. Those data storage units save all the important data and information of the system.
- **manage** (verb): to control; to manipulate
e.g. And this sound card over here, manages all the sound.
- **circuit** (noun): an electric system
e.g. That is to say that all the internal circuits and components that make a computer work are basically its hardware.
- **upgrade** (verb): to make something better by changing some of its parts
e.g. Plus, as these are elements that we can physically touch, we can change and upgrade them at any time to have a better computer.

Learning Points

Present Continuous for Current Events

We use the **present continuous** to refer to current actions happening at the moment of speaking or that are temporary.

You can use the **present continuous** to express the idea that something is happening right now. It is important to follow the structure for this tense:

Subject + verb 'to be' (am / is / are*) + verb in-ING form.

*Remember that we conjugate the verb 'to be' according to the subject of the sentence. Check the following chart:

Pronoun	Conjugation of verb 'to be'
I	am
He / She / It	is
You / We / They	are

For example:

*I **am learning** about hardware in this class.*

*She **is working** for this hardware company.*

*They **are talking** about the definition of hardware.*

Examples

- Hello class, this week we are learning about computer systems, so today I am making this presentation to you about a very important topic, which is hardware.*
- When we talk about hardware, we are referring to all the electrical, mechanical, and electronic components of a computer system.*

Learning Points

What Is Hardware?

The **hardware** in a computer is the group of physical components that form the system.

We can define *hardware* as the important physical parts of any system. Some of the common hardware components of any computer system are the motherboard, monitor, keyboard, hard disk drive (HDD), graphic cards, sound cards, and memory (RAM), among others.

The hardware is the collection of all the parts that you can physically touch, change, or manipulate. Let's check the functions of some of the hardware components we checked above:

HARDWARE	FUNCTIONS
Motherboard	It is the most important component as it contains important circuits and chips that run the software.
Monitor	The screen in which we can see all the outcome of the system. On it we can see the applications, videos, and pictures that come from the system.
Keyboard	The element you use to type in information to the system.
Computer data storage	A hard drive that saves all the important information of the system.
Data storage devices	External devices that save data, such as USB drives, CDs, and DVDs.
Graphic card	A card that controls and runs graphics such as pictures, videos, or animations.
Sound card	A card that controls and runs the sound of the system, such as the audio in music, videos, among others.
