Let's Start!

Let's talk about BPMN

Learning Outcome:

Gives information about instruments for data collection.

Apply methods for data collection, designing the necessary instruments for information processing, according to the situation set by the company.

Ask your partner:

- What models do you know to diagram a business process?
- How many programs of graphic representation do you know about?

Can Do Statements:

- I can describe a business process model and notation diagram.
- I can talk about the components of a Business Process Model and Notation, BPMN.
- I can give an example of a business process model and notation.

Let's Explore!

An Interview* with a BPMN Expert

*"Interview" is a series of questions about a specific topic.

Instructions: Read the text below.

Margaret: In this lesson, we are going to describe what BPMN is and we are going to create one based on a fictitious example. BPMN stands for Business Process Model Notation, it is a model that every business can apply to have a visual representation of its different processes. The main components of a BPMN are the flow objects, connecting objects, swim lanes and artifacts.

Henry: What are the foundations of these flowcharts?

Margaret: Basically, the foundations are the swim lanes; they consist of pools (rectangles) and lanes. They help us define the participants in the process. For example, imagine the finance department of a company. I draw a pool and three lines. This pool in black represents the whole department and their participants. In each line, I put, in various colors, the activities that every participant does.

Henry: And what about other elements like flow objects?

Margaret: Yes, they are key factors in the BPMN. The flow objects are events that normally are represented in circles, then, we have the activities that are symbolized by rectangles with rounded corners. As you remember, I put one activity per area. These activities can be the major task or sub-processes. There is another item, which is the gateways. Diamonds represents them. They are shifts that can be tracked one way or another inside the process.

To visually improve your BPMN flowcharting, you can use a variety of connecting objects. You can choose from sequence flows, message flows or associations.

Henry: And what is an artifact?

Margaret: That is an important item! The artifacts are data objects, group, and notations. They give extra information and most of the time they are written notations.

**Let's Practice!**

Margaret talks about a BPMN and some of its components*.

*"Components" means elements or parts of something.

Instructions: Proofread the sentences. Correct the mistakes. Write the corrected sentences on the lines provided.

1. Three components of a BPMN are the swim lanes, the artifacts or the flow objects.

2. BPMN can do a major task but sub-processes.

3. On BPMN, you can choose message flows and sequence flows to improve flowcharting.

**Let's Practice!**

Now, Margaret describes what a BPMN is and what it does.

Instructions: Read the text and underline all the sentences about the description of a BPMN. Read the paragraph aloud. Check your pronunciation with your instructor.

OK, remember that BPMN is a model that business can use to explain different processes. The processes can be in the finance department of a company, for example. This model has visual representations like lines, circles or diamonds. Also, BPMN has written annotations sometimes.

Extension Activity

Now, create your BPMN for a fictitious small company.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about a BPMN.
- Design and make a fictitious BPMN for a small company. (Remember to use graphical representations)
- Include on Include information about departments, participants and events of the company in your BPMN.
- Show your BPMN to your classmates and discuss your ideas.

Self-Assessment

Yes

No

- I research about BPMN.
- I create an example of a BPMN for a small company.
- I remember the important parts of a BPMN in a company.
- I Share my BPMN with classmates and complement ideas.

☐	☐
☐	☐

Target Words

- **fictitious** (adjective): fake, invented or a copy of something
e.g. We are going to understand what BPMN is and we are going to create one based on a fictitious example.
- **apply** (verb): to employ or use
e.g. It is a model that every business can apply to have a visual representation of its different processes.
- **pool** (noun): in a flowchart it refers to the rectangle that contains lanes to input data
e.g. Basically, the foundations are the swim lanes; they consist of pools and lanes.
- **key** (noun): a special item that is important
e.g. Yes, they are key factors.
- **shift** (verb): a change for another person, things, animal or idea
e.g. They are shifts that can be tracked one way or another inside the process.
- **item** (noun): an special article, topic, idea or object
e.g. That is an important item!

Learning Points

Simple Connectors: Or

In English you can use connectors so that you can do different associations between words and clauses. These connectors are known as conjunctions because they work as links between ideas and give certain emphasis to the sentences they join.

The most common simple connector are **but, and, nor, yet** and **or**.

The pattern looks like this:

Main Clause + , + Simple Connector + Main Clause

In this lesson you are going to study:

OR: You can use this coordinating conjunction to suggest that only one option can be performed. It can be used to recommend one thing or another when there are options to choose from.

Example:

- *I can represent a department **or** a complete company by using a diagram.*

Examples

- *These activities can be the major task or sub-processes.*
- *They are shifts that can be tracked one way or another inside the process.*

Learning Points

The Business Process Model And Notation (BPMN)

BPMN stands for **Business Process Model Notation**, and it is a standard model to visualize the processes in a business. Before this model, it did not exist a common language or a common graphical representation in a business process.

The main idea of **BPMN** is to use a common language as a model that every business can apply to have a visual representation of its different processes.

An organization called **BPMI** (Business Process Management Initiative) developed this model, which has been preserved by the **Object Management Group** since both organizations merged in 2005.

The diagram is a standard or universal form of representing a process. The main components of a **BPMN** are the flow objects, connecting objects, swim lanes and artifacts.

NOTE: The **Business Process Model and Notation** is not part of software engineering but it might help business identification processes. **BPMN** is not implemented in software engineering because we use **Use Cases** to identify business processes in the area of software engineering.

Examples

- *A BPMN is a model that every business can apply to have a visual representation of its different processes.*
